

the Digital Signage Network Manager

realtime monitoring

- ▶ Manage any digital signage software
- ▶ Scalable to manage large networks
- ▶ View screenshots in real-time
- ▶ Retrieve telemetry data
- ▶ Interactive remote file explorer
- ▶ Automated task processing
- ▶ Control screens and hardware installed with player

The Digital Signage Network Manager is the most advanced network manager for digital signage networks available today. The manager provides a wealth of management features that ensure you have full control over your digital signage network, and that you are able to detect and resolve any points of failure, minimizing screen downtime and maintaining customer satisfaction.

By deploying the management agent on a player device you will be able to control playback, execute applications, update the registry, control the display resolution, audit the hardware, retrieve screenshots and more. The agent will also monitor for any popup dialog windows appearing over your digital signage displays, when a popup is detected the agent closes the window and relays the window message back to the management server. The agent includes an Image retention scanner that will advise you when a portion of the display has not changed over a long period of time allowing you to address the problem before screen burn occurs.

The agent will also monitor the player software and other applications running on the device for memory leaks, when a leak is detected a message is relayed to the server and the agent may take corrective action such as restarting the device or the application in order to release virtual memory.

The agent will monitor the player application and if the player crashes out the agent will restart the player.

The network management interface includes a network diagramming tool that can be used to document your network and include non-playback devices as part of the management process. These devices can be pinged on a regular basis as part of a monitoring cycle.

The Digital Signage Network Manager can be used to monitor any digital signage network that is based on Windows XP or Vista simply by installing the agent software.

HELPING YOU DO IT RIGHT EVERY TIME.
